Donde podemos buscar

<https://prospero.io/domain-search>

The screenshot shows the Prospero Domain Search interface. At the top, there's a navigation bar with links for Products, Resources, Pricing, Blog, Login, and Get Started. Below the navigation is a large search input field containing "ekoparty.org". To the right of the input is a red "Find emails" button. On the left side of the search field, there's a snippet of information about "Ekojobs" from LinkedIn, mentioning they believe the world needs more hackers. Below the search field, it says "Emails pattern: {first}@ekoparty.org". The main search area has three tabs: "Find emails by names", "Find emails by company", and "Find mobile number". To the right of the search area is a stylized geometric graphic of interconnected cubes.

Luxottica: In March 2021, the world's largest eyewear company Luxottica suffered a data breach via one of their partners that exposed the personal information of more than 70M people. The data was subsequently sold via a popular hacking forum in late 2022 and included email and physical addresses, names, genders, dates of birth and phone numbers. In a statement from Luxottica, they advised they were aware of the incident and are currently "considering other notification obligations".

Compromised data: Dates of birth, Email addresses, Genders, Names, Phone numbers, Physical addresses

Dota2: In July 2016, the Dota2 official developers forum suffered a data breach that exposed almost 2 million users. The hack of the vBulletin forum led to the disclosure of email and IP addresses, usernames and passwords stored as salted MD5 hashes.

Compromised data: Email addresses, IP addresses, Passwords, Usernames

Combolists Posted to Telegram: In May 2024, 2B rows of data with 361M unique email addresses were collated from malicious Telegram channels. The data contained 122GB across 1.7k files with email addresses, usernames, passwords and in many cases, the website they were entered into. The data appears to have been sourced from a combination of existing combolists and info stealer malware.

Compromised data: Email addresses, Passwords, Usernames

Stealer Logs Posted to Telegram: In July 2024, info stealer logs with 26M unique email addresses were collated from malicious Telegram channels. The data contained 22GB of logs consisting of email addresses, passwords and the websites they were used on, all obtained by malware running on infected machines.

Compromised data: Email addresses, Passwords

Not SOCRadar: In August 2024, over 332M rows of email addresses were posted to a popular hacking forum. The post alleged the addresses were scraped from cybersecurity firm SOCRadar, however an investigation on their behalf concluded that "the actor merely utilised functionalities inherent in the platform's standard offerings, designed to gather information from publicly available sources". There is no suggestion the incident compromised SOCRadar's security or posed any risk to their customers. In total, the data set contained 282M unique addresses of valid email address format.

Compromised data: Email addresses

LeakSearch

LeakSearch is a simple tool to search and parse plain text passwords using ProxyNova COMB (Combination Of Many Breaches) over the Internet. You can define a custom proxy and you can also use your own password file, to search using different keywords: such as user, domain or password.

In addition, you can define how many results you want to display on the terminal and export them as JSON or TXT files. Due to the simplicity of the code, it is very easy to add new sources, so more providers will be added in the future.

```
[>] Searching for ekoparty.org leaks in ProxyNova...
[*] Found 0 different records in database
[!] No leaks found in ProxyNova!
```

Donde podemos buscar

<https://www.proxynova.com/tools/comb/>

Search the world's largest dataset of leaked passwords

In February of 2021, the largest dataset of leaked credentials (emails, usernames, and passwords) named COMB (**Combination Of Many Breaches**) [was leaked to the public](#). It was the largest data leak of all time, containing over **3.2 billion credentials** combined across from various other data breaches over the years from services such as Netflix, LinkedIn and many others. The purpose of this tool is to make that massive dataset of leaked usernames and passwords easily searchable, and to encourage better security practices by giving people an ability to check if their credentials were leaked and thus exposed to hackers.

If you find yourself on this list - **change your password immediately**, and always enable two factor authentication whenever possible. Your searches are not logged nor ever stored on our servers.

Telegram APIs

We offer three kinds of APIs for developers. The [Bot API](#) allows you to easily create programs that use Telegram messages for an interface. The [Telegram API and TDLib](#) allow you to build your own customized Telegram clients. You are welcome to use both APIs free of charge. Lastly, the [Gateway API](#) allows any business, app or website to send verification codes through Telegram instead of traditional SMS.

You can also add [Telegram Widgets](#) to your website.

Designers are welcome to create [Animated Stickers](#) or [Custom Themes](#) for Telegram.

Bot API

This API allows you to connect bots to our system. [Telegram Bots](#) are special accounts that do not require an additional phone number to set up. These accounts serve as an interface for code running somewhere on your server.

To use this, you don't need to know anything about how our MTProto encryption protocol works — our intermediary server will handle all encryption and communication with the Telegram API for you. You communicate with this server via a simple HTTPS-interface that offers a simplified version of the Telegram API.

[Learn more about the Bot API here »](#)

Bot developers can also make use of our [Payments API](#) to accept payments from Telegram users around the world.

TDLib – build your own Telegram

Even if you're looking for maximum customization, you don't have to create your app from scratch. Try our [Telegram Database Library](#) (or simply TDLib), a tool for third-party developers that makes it easy to build fast, secure and feature-rich Telegram apps.
